Introduction

- Metal artifacts strongly reduce the diagnostic value of CT images
- Metal artifacts are caused by a combination of scatter, beam hardening, and photon starvation
- Even frequency split normalized metal artifact reduction (FSNMAR), the gold standard, cannot fully remove artifacts

Conventional vs. Photon Counting CT

Conventional CT

- 1 image to correct
- No additional information

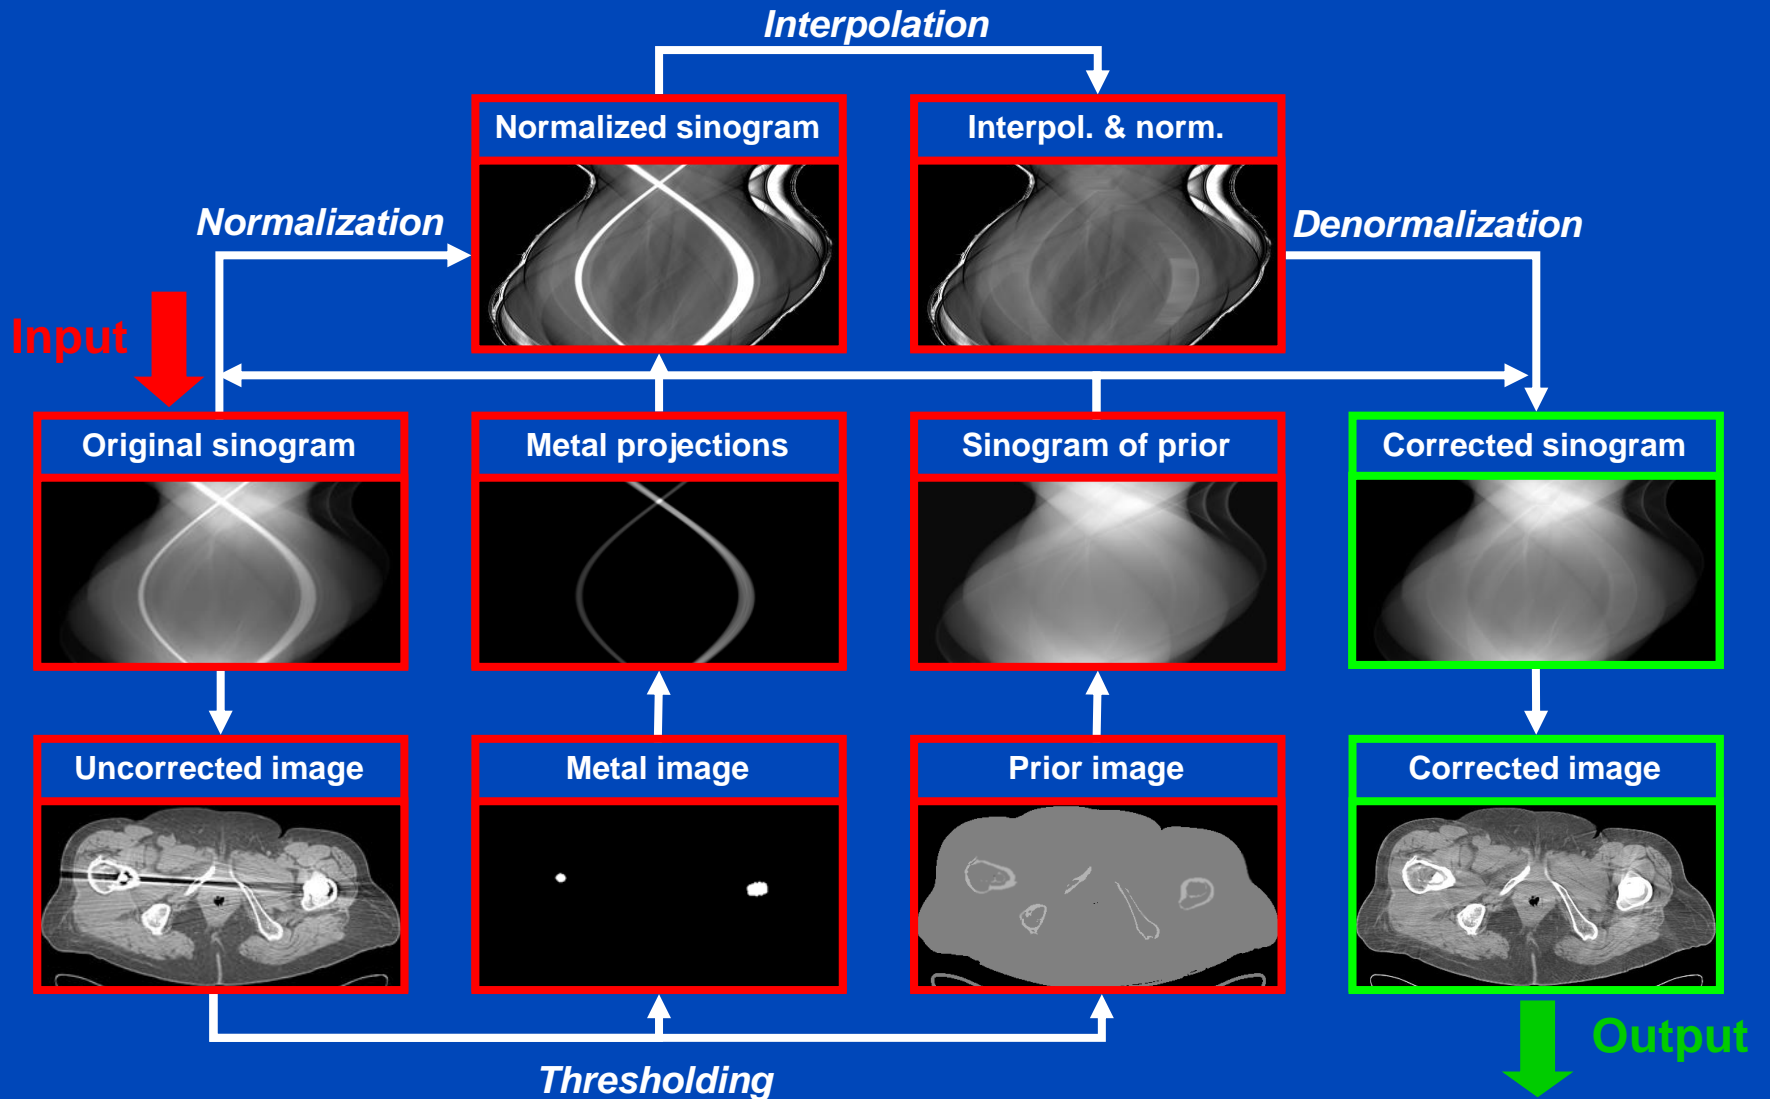

Photon Counting CT (PCCT)

- 4 images to correct
- Additional spectral information

C = 50 HU, W = 700 HU

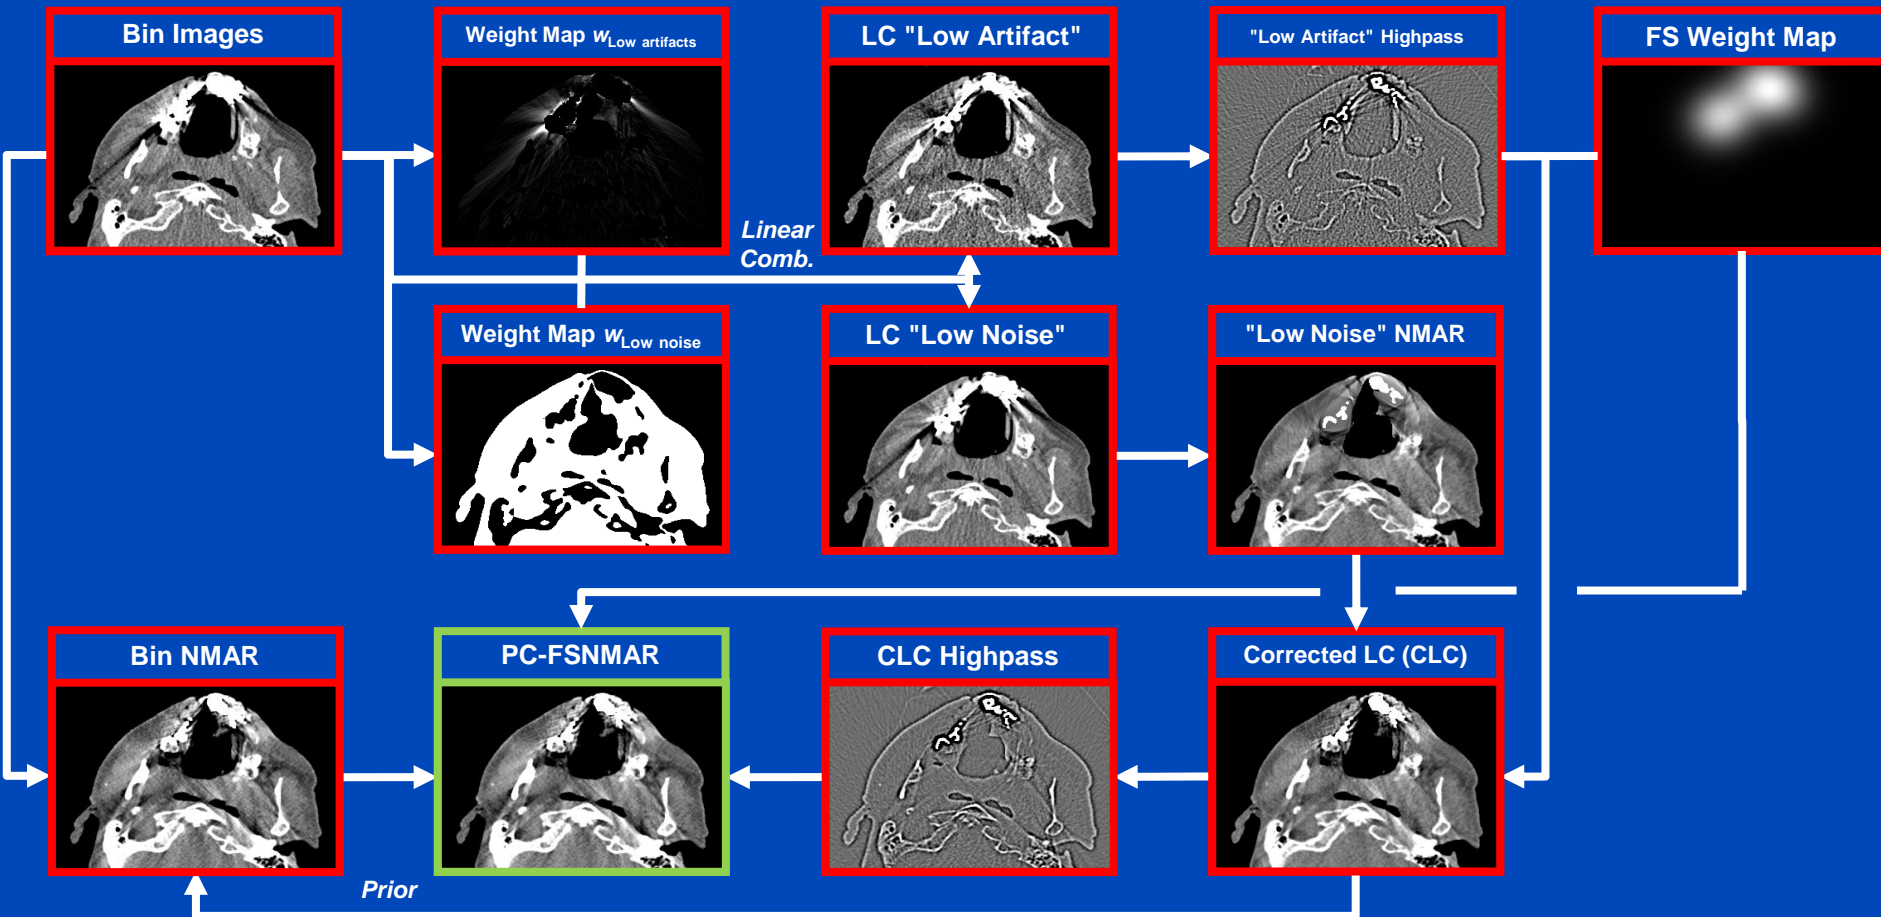

Normalized MAR (NMAR)

Frequency Split NMAR (FSNMAR)

PC-FSNMAR Scheme

Optimization

- The optimization uses a Nelder-Mead algorithm that minimizes a cost function C with respect to the linear combination LC .
- $C(LC, w) = L(LC, w) + \lambda TV(LC, w)$
- $L(LC, w) = \sum_{i,j} w(i, j) LC^2(i, j)$
- The weight map $w(i, j)$ is non-zero only for soft tissue
- $TV(LC, w)$: reduces streaks and smooths the image
- $L(LC, w)$: penalizes large homogeneous Artifacts
- Choice of w and λ determine the properties of the LC

$w_{\text{Low noise}}$

$w_{\text{Low artifacts}}$

Measurements

CT data of forensic specimen (approval by ethics board S-388/2014) were obtained from a Siemens SOMATOM CounT with

- Voltage: $U = 140$ kV
- Tube current: $I_{\text{eff}} = 300$ mAs
- Eff. slice thickness: $S_{\text{eff}} = 0.6$ mm
- Pixel size: $\Delta x = \Delta y = 0.5$ mm
- Energy thresholds: 25/45/75/90 keV
- Reconstruction kernel: B40f

Analysis

- To quantify image quality, we employ these measurements:
 - Artifact content: standard deviation of an ROI with metal artifacts
 - Image quality: contrast-to-noise ratio of soft tissue and bone; one ROI in each tissue

$C = 50 \text{ HU}$, $W = 700 \text{ HU}$

Results

Bin 1

Bin 2

Bin 3

Bin 4

Original

$\sigma_A = 953.9$ HU, CNR = 7.4

$\sigma_A = 1005.3$ HU, CNR = 8.6

$\sigma_A = 830.0$ HU, CNR = 7.5

$\sigma_A = 484.1$ HU, CNR = 8.0

FSNMAR

$\sigma_A = 122.5$ HU, CNR = 8.8

$\sigma_A = 132.2$ HU, CNR = 10.4

$\sigma_A = 133.4$ HU, CNR = 8.6

$\sigma_A = 87.8$ HU, CNR = 10.0

PC-FSNMAR

$\sigma_A = 94.4$ HU, CNR = 9.4

$\sigma_A = 94.8$ HU, CNR = 10.6

$\sigma_A = 88.3$ HU, CNR = 9.0

$\sigma_A = 87.5$ HU, CNR = 10.4

C = 50 HU, W = 700 HU

PC-FSNMAR

C = 50 HU, W = 700 HU

Conclusion

- **PC-FSNMAR significantly improves image quality compared to conventional bin-wise FSNMAR**
- **Regions close to the metal show more details**
- **Artifacts are reduced without sacrificing CNR**
- **Some artifacts remain**

Thank You!

The 6th International Conference on Image Formation in X-Ray Computed Tomography

August 3 - August 7 • 2020 • Regensburg (virtual only) • Germany • www.ct-meeting.org

© Bild Regensburg Tourismus GmbH

Conference Chair: **Marc Kachelrieß**, German Cancer Research Center (DKFZ), Heidelberg, Germany

This presentation will soon be available at www.dkfz.de/ct.
Job opportunities through DKFZ's international Fellowship programs (marc.kachelriess@dkfz.de).
Parts of the reconstruction software were provided by RayConStruct® GmbH, Nürnberg, Germany.
